2" Diameter x 3.5" Tall,
6cm Diameter x 9cm Tall,
5.4 ounces / 154 grams

Available as singles, doubles
or in 3 piece boxed kits.
All candles are sealed in poly bags,
and all packaging is labeled with
UPC bar code.

Private Label Available

Exotic Spa Candles™ are made in Edmonton, Alberta (Canada), using highly refined paraffin wax to create a sensual product that has similar properties to the wax used for spa treatments. These candles are designed for sensual, soothing sensation, softening and warming the skin they are applied to.

Exotic Spa Candles™ melt at 92-98°F / 33-36°C. For comparison hot tubs go as high as 104°F/40°C. This temperature is safe for most skin types when dripped from a height of 8”/ 20 cm or more away from the skin.

WARNING: Do not use general purpose candles for dripping on the skin! Typical carnauba wax candles melt at 180°F/ 82°C, which is still much too hot for human skin, and beeswax candles can melt at temperatures as high as 212°F / 100°C which is enough to boil water! Paraffin wax also varies, with some forms melting as high as carnauba wax.

*** Not Suitable *** for all skin types. Always test on a small area first, have a cold cloth ready.

How To Use Exotic Spa Candles™

1. Ensure that you have a safe area to place the lit candles. The surface should be flat and stable, away from any flammable objects such as curtains. To protect the surface that the lit candle will be placed on you may want to use a sheet of wax paper.

2. Plan ahead! We recommend having a cold wet cloth handy to cool the skin if needed, a towel or cloth for removing any left over wax, drinking water for the person who is receiving the wax, baby oil or powder (See Below), and a lighter.

3. Protect the surface you will be using for your person receiving wax. We use a cloth drop sheet! Also suitable are plastic drop sheets, shower curtain liner, or an old table cloth. The wax will likely soak into the material you use to protect the surface, and may leave oil stains.

*** Optional ***
Smooth baby oil or powder over the skin. A light coating of either makes the wax removal process a breeze, and if using oil the heat of the wax disperses along the surface, which is a lovely sensation.

4. Remove the Exotic Spa Candle from packaging, trim the wick and light. If the candle smokes the wick may be too long. If your wick is short and the flame sputters out, hold the candle at a slight angle and rotate so the flame can melt a divot around the wick.

5. From a height of 12-18”, hold the candle above the skin that is to receive the wax. Tilt the candle slightly, allowing melted wax to drip onto the skin.

6. Check in with your person! If they feel that the wax is too warm, give them a second to process. When the wax initially touches the skin it feels very warm! When they are ready, drip more wax. If they wish the wax to feel warmer, move closer to the skin, adjust height for the comfort of your person.

*** Note ***

When you drip wax on a spot that has cooled wax on it already, the heat does not transfer as well, which means you can drip the wax from closer to the skin. If you continue to drip wax on the same spot for a time, the heat will increase. If the wax is allowed to melt on the candle for a moment, creating a small pool of melted wax by the wick, it will be slightly warmer than when dripped while melting.

7. Experiment to see what areas feel more or less sensitive, and what sensations different types of pouring creates. Wax can feel sensual, ticklish, stimulating or intense, depending on where and how it is poured/dripped.

Clean Up:

The wax will peel off skin easily if you used oil or powder. Areas where the skin was dry or hairy may require that you lightly rub the skin with a rag or towel. Roll up the protective sheet and shake wax into garbage.

Pro Tip:

Skin is very sensitive after wax is removed. Experiment with other textures on the skin, from fur to fingernails!
